Mining Data from customer support tickets is generally a daunting task for anyone, considering that it generally takes months to be able to extract useful information. Moreover, for those who aren't tech-savvy, the process becomes even more complex. Recently, customer support staff from a company called Wordpress.com, took to Twitter to seek an alternative solution for capturing data from its customer support portal. The company found that majority of its customers were sharing their experience through a chat feature in their conversations with their support staff, and hence found it challenging to mine data from these conversations. Since the discussions were happening through the customer support portal, the natural question that followed was – how could the team extract data from the internal conversation from customer support staff, and how could the data be extracted and analysed to reveal more insights about the support ecosystem? The Wordpress.com team thus turned to Anaconda cloud, a powerful deep learning stack to their own advantage. They created a predictive intelligence model that could extract relevant data by analyzing the conversations, and even predicted future conversations that should be allowed. With predictive deep learning at their disposal, they set out to develop an algorithm that could analyze the conversations and extract relevant information for their internal processes and product to deliver better services for their customers. What were the insights? Analyzing the conversations with their predictive deep learning model, the team found that the most common problem being faced by customers was related to the staff training. Moreover, often, they are requested to share their queries in a vague manner, so that the question doesn't get closed. Based on this b7e8fdf5c8

Lightning Editor (Lightning EDITOR), the latest update on the popular universal text editor for Windows. it's also a fully fledged IDE with key features such as Code Completion, Code Assistance, Rebuilt Syntax Highlighting, Indexing and Searching, Syntax and Document Map, advanced Settings and much more! Dynamic tooltips in Visual Studio Description Visual Studio adds tooltips at the end of some statements in your code, like if statements, for loops, while loops and the like. These are typically used for quickly checking if the variables are properly initialized, to see if a specific part of the code is being executed, or to get an idea of what these statements do. With this extension you get contextual tooltips for C# and VB.NET, showing not only the values of the variables, but also the type of the variables, as well as their initial values. This can of course be configured for more than just variables, and not all types are supported, but it's still a handy addition. The extension works with both C# and VB.NET and is backward compatible with Visual Studio 2013. Features Tooltip for C# and VB.NET Contextual tooltips for variables, properties and other statements Backward compatible with Visual Studio 2013 BASIC Programming in Visual Studio Description Visual Studio has some basic features to help you develop code, such as if statements, basic string functions, or arrays. However, there's still more to do, such as to write your own functions and to check if a variable or array element is properly initialized. The BASIC programming language extension for Visual Studio, by Developer Geeks, offers more of the basic features than Visual Studio alone. First, it adds a TOOLE, WIPPLE and TEXTBOX function to the BASIC language. These functions can be used to better interact with other applications, and to check if a message box can be displayed. There's also a more complete string function support, using a library from Developer Geeks. Functions can also be used to write your own functions, and you can query the variables used for the context, or check if a statement or block of code is active. The extension works on both C# and VB.NET, and is backward compatible with Visual Studio 2013. Extensive perineural invasion is the only independent prognostic factor predicting incomplete resection in endoscopically-assisted total mesorectal excision for rectal cancer. Treatment outcomes of patients with rectal cancer in Japan are inferior to those in Western countries. To improve treatment outcomes, we applied the concept of total mesorectal excision (TME) to surgical resection for rectal cancer in Japan. However, there is no consensus on the extent of resection required by rectal cancer. A total of 95 patients who underwent TME and intraoperative chemoradiotherapy for rectal cancer from June 2005 to June 2007 were included in this retrospective study. Perineural invasion (PNI) was assessed by hematoxylin and eosin (H&E) and immunohistochemical staining with the S-100 protein antibody. The relationship between PNI and treatment outcomes was evaluated. The median follow-up period was 40 months (range, 5-63 months). Dukes' Stage B1-3, pT3, and pN+ patients had a significantly higher incidence of PNI than those with Dukes' Stage B1-2 and pT2 and pN0 ($P = 0.002$ and $P = 0.001$, respectively). The 5-year disease-free survival (DFS) rate was significantly worse for patients with PNI than those without ($P = 0.0012$). Multivariate analysis showed that PNI was the only independent prognostic factor for DFS, with a hazard ratio of 0.35 ($P = 0.0004$). The results of our study indicate that TME with extended surgical resection to include resection of the PNI region is necessary to improve the treatment outcomes of patients with rectal cancer. Prediction of protein structure from sequence using a neural network. A method for predicting the tertiary structure of proteins from their amino acid sequences is developed. The computational algorithm uses a neural network
